rush search

Hi Christina, 10/015,393 is a date case that I must finsih this bi-week. Would you kindly approve this rush search. Thank you very much.

Stic,

Please search SEQ ID NOs:115 and 116 of 10/015,393 against commercial and interference data bases.

The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCR primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GCCACCATCCCTGGGAAGACGGTCATCGTGACGGCGCGCCAACACAGGCATCGGGAAGCAG

                                      The present invention relates to secreted and transmembran These proteins and the DNA encoding them may be used as hy probes, in chromosome and gene mapping and in the generatisense RNA and DNA. They may also be used used to generate transgenic animals or knockout animals which are in turn u development and screening of therapeutically useful reagen acids may also be used in gene therapy

                                                                                                                                                                                                                                                                                                                            240
                                                                                                                                                                    The invention relates to human PRO polypeptides and the polynucleotides encoding them. The sequences are useful in the preparation of a medicament for treating a condition responsive to a PRO polypeptide. The polypeptides are useful in a number of functional biological assays, as molecular weight markers for protein electrophoresis and as therapeutic

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 123 fully defined sequences as convention acid sequence signal peptides. Also include are the nucleotide (NA) sequences encoding PRO, a vector comprising the PRO NA, a vector comprising the vector, producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an antiport of suseful as molecular weight markers for protein PRO antibody. Pro is useful as molecular weight markers for protein cletrophoresis and also for chromosome identification. PRO is also useful for tissue typing. PRO and PRO NA are useful as hybridisation brobes for a cDNA library to isolate the full-length PRO cDNA. PRO NA is useful in development and screening useful reagents. PRO NA is also useful for treating cancerous tumours. PRO1303 polypeptides are useful for treating cancerous tumours. PRO1248 and PRO1410 polypeptide is useful for treating candience propried is useful for treating canciency for science prolypeptide is useful for treating canciency prolypeptide are useful for stimulating calcium flux in human complical vein endothelial cells. PRO1265, PRO1250 and PRO1474 umbilical vein endothelial cells. PRO1265, PRO1250 and PRO1474
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fong S;

(e.g., arthritis) and wound healing. PRO1130, PRO1275 and PRO1418 polypeptides are useful for treating diabetes in skeletal muscle cells and obesity. PRO1265, PRO1244 and PRO1382 polypeptides are useful for treating Berger disease or other nephropathies associated with Schonlein-Henoch purpura, coeliac disease, dermatitis, herpetiformis or Crohn's disease. PRO1478, PRO1265, PRO1412, PRO1279, PRO1304, PRO1306, PRO1418, PRO1410 and PRO1575 are useful in treating thalassaemias. The present sequence encodes a PRO protein of the invention.

NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

/note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I;
UI-E-EJO is a subtracted cDNA library constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are: fetal eyes,
AGAATCAAGA; lens, CGATTAGGGA; eye anterior segment,
AATGCGCAT; optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and Macular, GTCC; RPE and Choroid, ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1050

receptor or secreted peptide or small interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                  AAA37022 to AAA37144 encode the new isolated human transmembrane, receptor or secreted PRO polypeptides given in AAY99340 to AAY99462. The transmembrane and receptor PRO proteins can be used for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interactions. The polypeptides and nucleotide sequences encoding then have various industrial applications, including uses as pharmaceutical and diagnostic agents. AAA37145 to AAA37330 represent PCI primers and hybridisation probes used in the isolation of the PRO polypeptides from the present invention
                                                                                                                                                                                                                                                                                                      н

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to secreted and transmembrane proteins. These proteins and the DNA encoding them may be used as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. They may also be used used to generate either transgenic animals or knockout animals which are in turn useful for development and screening of therapeutically useful reagents. The nuclaseds may also be used in gene therapy

decreased expression of DME. Examples of such disorders include, autoimmune/inflammatory disorder such as acquired immune deficiency syndrome (AIDS), rheumatorid arthritis, osteoporosis; cell proliferative disorder such as actinic keratosis, atherosclerosis; developmental disorder such as actinic keratosis; andocrine disorder such as acromegaly, cretinism, thyrotoxicosis; pancreatic disorder such as acromegaly, cretinism, thyrotoxicosis; pancreatic disorder such as acromegaly, cretinism, thyrotoxicosis; pancreatic disorder such as disorder such as anorexia, dysphagia and hepatic tumours including metabolic disorder such as anorexia, dysphagia and hepatic tumours including disorder such as anorexia, dysphagia and hepatic tumours including nodular hyperplasia, adenomas and carcinomas. DME DNA is useful for creating 'knockin' humanised animals (pigs) or transgenic animals (mice or rats) to model human disease. DME DNA is also in useful is gene therapy. DME and its immunogenic fragments are useful for screening therapys of compounds in several drug screening assays
                                                                                                                                                                                                                                                                                                                                                                                        120

protein genes and AAE37272-AAE37295 represent the proteins they encode.

AAE37296-AAE37299 represent human secreted proteins they encode.

AAE37296-AAE37299 represent human secreted protein fragments. The genes and their corresponding proteins are useful in diagnosing, preventing or treating diseases or conditions such as hyperproliferative disorders (e.g. cancer), immune/haematopoietic disorders (e.g. anaemia, multiple myeloma, arthritis, asthma, acquired immune deficiency syndrome (AIDS), rheumatoid arthritis, inflammation, psoriasis, diabetes, systemic lupus erythematosus or allergy), reproductive system disorders (e.g. amenorrhoea or epididymitis), musculoskeletal disorders (e.g. gout or multiple sclerosis), cardiovascular disorders (e.g. arrhythmia, congestive heart failure, hypertension or atherosclerosis), genetic disorders (e.g. neurolighical disorders (e.g. Alzheimer's disease or Parkinson's disease), respiratory disorders (e.g. alphysema or bronchitis), endocrine disease), infections or wounds. Polynucleotides of the invention may also be used for chromosome mapping or drug screening. They are also useful in gene therappy. The present sequence represents a human secreted protein of the
